Running of Client

The client program can be run in `Linux` and `Mac OS` .

Enter the `src` folder and type in `make` in the Terminate, the executable file is then generated. Type in `./client` to run the client, the "client" program can accept two paramaters:

`-port n` means the ftp server accepts clients' connection via port n. If the program does not receive this parameter, default to port 21. `-ip xx.xx.xx.xx` means the ip address of the ftp server to connect. If the program does not receive this parameter, default to local host (127.0.0.1).

The directory where the program "client" stays will serve as the root path for the client, which means that all downloaded files will be saved to this directory and only the files saved in this directory can be found and uploaded.
